

13. Use Case Implementation - getting to work:

Aim:- To Implement a use case in a software project that demonstrates how a specific function or feature works using programming logic

Algorithm:

1. Start
2. Identify the use case to implement (for example user login)
3. Design the work flow.
4. Write a program to simulate this logic
5. Execute the program and validate output.
6. Stop.

Program :-

use case implementation : user login system.

Step 1: Define valid credentials.

valid_username : "admin"

valid_password : "1234"

Step 2: get user input

username = input("Enter username:")

Password = input("Enter password:")

Step 3: Validate login

if username == valid_username and password == valid_password :

else

L

Output:

Enter username : admin

Enter password : 1234

login successfully.

```
print ("logic failed ! Invalid credentials.")
```

EXCEL TECH CSR	
EX NO.	_____
PERFORMANCE (5)	_____
RESULT AND ANALYSIS (5)	_____
VIVA VOCE (5)	_____
RECORD (5)	_____
TOTAL (20)	_____
SIGN WITH DATE _____	

Result:-

The program successfully implements a user can verify credentials and display appropriate responses.
